1. Abstract

This document specifies the Fault Management (FM) Management Information Base (MIB) necessary to implement the Service Operations, Administration, and Maintenance (OAM) that satisfies the Service OAM requirements and framework specified by MEF 17 [8], the Service OAM Fault Management requirements as specified by SOAM-FM [10], and the Service OAM management objects as specified by MEF 7.1 [5] which are applicable to Fault Management functions. Two non-MEF documents serve as the baseline documents for this work: ITU-T Y.1731 [17] and IEEE 802.1ag [20].

2. Terminology

Term	Definition	Source
AIS	Alarm Indication Signal	ITU-T Y.1731 [17]
BSS	Business Support System	
CoS	Class of Service	MEF 10.2 [7]
CCM	Continuity Check Message	IEEE Std 802.1ag [20]
CFM	Connectivity Fault Management	IEEE Std 802.1ag [20]
C-TAG	Customer (Subscriber) Tagged Frame	IEEE Std 802.1ad [19]
DEI	Drop Eligible Indicator	IEEE Std 802.1ad [19]
EMS	Element Management System	MEF 7.1 [6]
ENNI	External Network-to-Network Interface	MEF 4 [5]
ETH-AIS	Ethernet Alarm Indication Signal function	ITU-T Y.1731 [17]
ETH-CC	Ethernet Continuity Check function	ITU-T Y.1731 [17]
ETH-LB	Ethernet Loopback function	ITU-T Y.1731 [17]
ETH-LCK	Ethernet Lock signal function	ITU-T Y.1731 [17]
ETH-LT	Ethernet Linktrace function	ITU-T Y.1731 [17]
ETH-RDI	Ethernet Remote Defect Indication function	ITU-T Y.1731 [17]
ETH-Test	Ethernet Test function	ITU-T Y.1731 [17]
EVC	Ethernet Virtual Connection	MEF 10.2 [7]
FM	Fault Management	MEF 17 [8]
IEEE	Institute of Electrical and Electronics Engineers	
IETF	Internet Engineering Task Force	
ITU-T	International Telecommunication Union - Telecommunication Standardization Bureau	
LAN	Local Area Network	MEF 4 [5]
LCK	Locked, used in reference to LCK PDUs	ITU-T Y.1731 [17]
LBM	Loopback Message	IEEE Std 802.1ag [20]
LBR	Loopback Reply	IEEE Std 802.1ag [20]
LTM	Linktrace Message	IEEE Std 802.1ag [20]
LTR	Linktrace Reply	IEEE Std 802.1ag [20]
MAC	Media Access Control	IEEE Std 802.3 [21]
MA	Maintenance Association (equivalent to a MEG)	IEEE Std 802.1ag [20]
MAID	Maintenance Association Identifier (equivalent to a MEG ID)	IEEE Std 802.1ag [20]

Term	Definition	Source
MD	Maintenance Domain (equivalent to a "OAM Domain in MEF 17)	IEEE Std 802.1ag [20]
MD Level	Maintenance Domain Level (equivalent to a MEG level)	IEEE Std 802.1ag [20]
ME	Maintenance Entity	IEEE Std 802.1ag [20]
MEF	Metro Ethernet Forum	
MEG	Maintenance Entity Group (equivalent to a MA)	ITU-T Y.1731 [17]
MEG ID	Maintenance Entity Group Identifier. Equivalent to Maintenance Association Identifier (MAID).	ITU-T Y.1731 [17]
MEG Level	Maintenance Entity Group Level (equivalent to MD Level)	ITU-T Y.1731 [17]
MEN	Metro Ethernet Network	MEF 4 [5]
MEP	Maintenance Association End Point or MEG End Point	IEEE Std 802.1ag [20], ITU-T Y.1731 [17]
MIB	Management Information Base	RFC 2578 [2]
MIP	Maintenance Domain Intermediate Point or MEG Intermediate Point	IEEE Std 802.1ag [20], ITU-T Y.1731 [17]
MTU	Maximum Transmission Unit	MEF 10.2 [7]
NE	Network Element	MEF 4 [5]
NNI	Network-to-Network Interface	MEF 4 [5]
NMS	Network Management System	MEF 7.1 [6]
OAM	Operations, Administration, and Maintenance	MEF 17 [8]
OSS	Operations Support System	ITU-T Y.1731 [17]
PDU	Protocol Data Unit	IEEE Std 802.1ag [20]
RDI	Remote Defect Indicator	IEEE Std 802.1ag [20]
RFC	Request for Comment	
SOAM	Service OAM	MEF 17 [8]
SOAM PDU	Service OAM frames, or Protocol Data Unit. Specifically, those PDUs defined in [IEEE 802.1ag], [ITU-T Y.1731], or MEF specifications.	SOAM-FM [10]
Service Frame	An Ethernet frame transmitted across the UNI toward the Service Provider or an Ethernet frame transmitted across the UNI toward the Subscriber	MEF 10.2 [7]
SNMP	Simple Network Management Protocol	
SNMP Manager	An SNMP entity containing one or more command generator and/or notification receiver applications (along with their associated SNMP engine)	RFC 3411 [3]
S-TAG	Service (Provider) Tagged Frame	IEEE Std 802.1ad [19]
TC	Textual Conventions	RFC 4181 [3]
TLV	Type Length Value, a method of encoding Objects	
TST	Test PDU	ITU-T Y.1731 [17]
UML	Unified Modeling Language	
UTC	Coordinated Universal Time	SOAM-PM [11]
UNI	User-to-Network Interface	MEF 4 [5]

Term	Definition	Source
VID	VLAN Identifier	IEEE Std 802.1Q [17]
VLAN	Virtual LAN	IEEE Std 802.1Q [17]

Table 1 – Terminology

3. Scope

The scope of this document is to provide SNMP MIBs that support the Service OAM (SOAM) Fault Management functions that have been defined in MEF 17 [9], and SOAM-FM [10]. MEF 7.1, the *EMS-NMS Information Model*, provides the object models that have been implemented in this document for the SOAM functionality.

This document includes two MIBs necessary to support the MEF SOAM FM functionality: the **MEF-SOAM-TC-MIB** that includes the Textual Conventions (TC) for the SOAM MIB family and the **MEF-SOAM-FM-MIB** that includes extensions to Connectivity Fault Management (CFM) as developed in IEEE 802.1ag [20], including MIBs found in 802.1ag [20] and 801.ap [22], and enhanced by ITU-T Y.1731 [17] to support the SOAM FM functions as presented in the SOAM-FM [10] specification.

The primary purpose of this document is to provide a mechanism to enhance interoperability between equipment/software vendors and between Service Providers and/or Operators. This document provides the Metro Ethernet Forum (MEF) specific extensions to support SOAM functionality within the Metro Ethernet Networks (MEN) via SNMP MIBs.

4. Compliance Levels

The key words "**MUST**", "**MUST NOT**", "**REQUIRED**", "**SHALL**", "**SHALL NOT**", "**SHOULD**", "**SHOULD NOT**", "**RECOMMENDED**", "**MAY**", and "**OPTIONAL**" in this document are to be interpreted as described in RFC 2119 [1]. All key words must be in upper case, bold text.

5. Introduction

5.1 The Basic Need

One of the aspects of defining Metro Ethernet Networks (MEN) is the need to ensure the compatibility between equipment/software vendors and equipment operators in order to facilitate interoperability in local, metro, national, and international networks. One of the common ways to do this is through a common management interface using publically available or enterprise specific SNMP MIBs.

A MIB is a collection of managed objects that can be used to provision an entity, query an entity for status information, or define notifications that are sent to a Network Management System (NMS) or an Element Management System (EMS). Collections of related objects are defined in MIB modules which are written using an adapted subset of OSI's Abstract Syntax One, or ASN.1 [23]. Standards for MIB modules are set by IETF and documented in various RFCs, primary of

which are RFC 2578 *Structure of Management Information Version 2 (SMIv2)* [2] and RFC 4181 *Guidelines for Authors and Reviewers of MIB Documents* [4].

5.2 The General Structure

A generalized system model is shown by Figure 1 that illustrates the relationship between the OSS/BSS, NMS, EMS, and Network Elements (NE). The primary focus of this specification defines the interaction between the EMS and the NE via SNMP using the MIB modules defined in this specification.

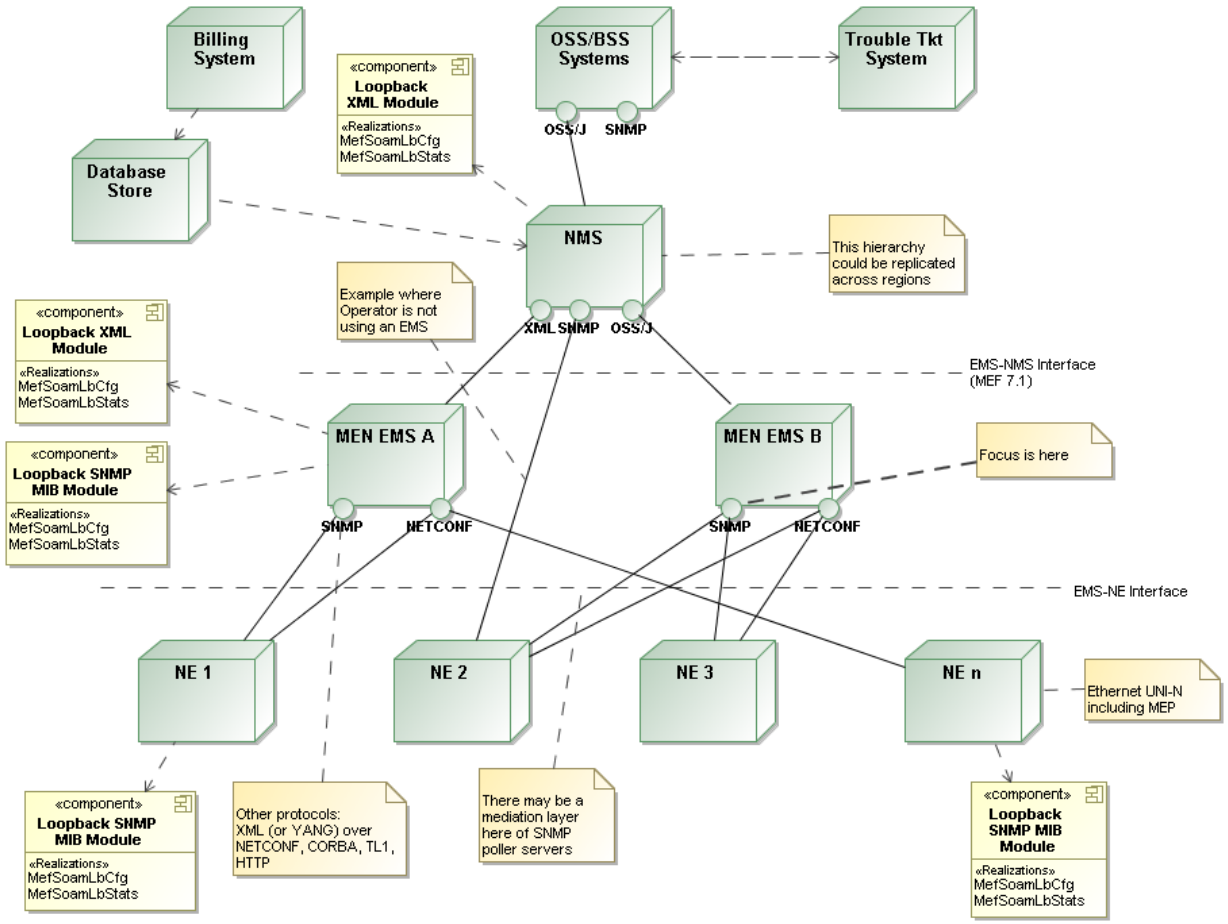

Figure 1 – Generalized OSS/BSS-NMS-EMS-NE Model

5.3 The Foundational Elements

MEF 17 [9] provides the Service OAM requirements and framework. It defines the OAM components and Service OAM requirements.

SOAM-FM [10] further defines the aspects of Service OAM requirements that deal with Fault Management (FM) and their extensions as needed to support MEF SOAM FM requirements.

SOAM-FM builds upon two existing documents: Connectivity Fault Management as defined in IEEE 802.1ag [20] and extended in ITU-T Y.1731 [17].

Service OAM Fault Management objects that provide the baseline for MIB objects defined in this specification are found in MEF 7.1 [6].

MEF 7.1 draws heavily upon the models defined in ITU-T Q.840 [16].

The relationship between the various documents and the FM and TC MIBs presented in this specification is illustrated by Figure 2. The UML models found in MEF 7.1 and G.8052 provide a baseline for the SOAM MIBs. A number of the tables/objects in the MIB extend the IEEE CFM MIB objects as well as providing new objects from ITU-T Y.1731 and the SOAM FM Implementation Agreement document. The MEF-SOAM-PM-MIB is shown in the figure for reference only.

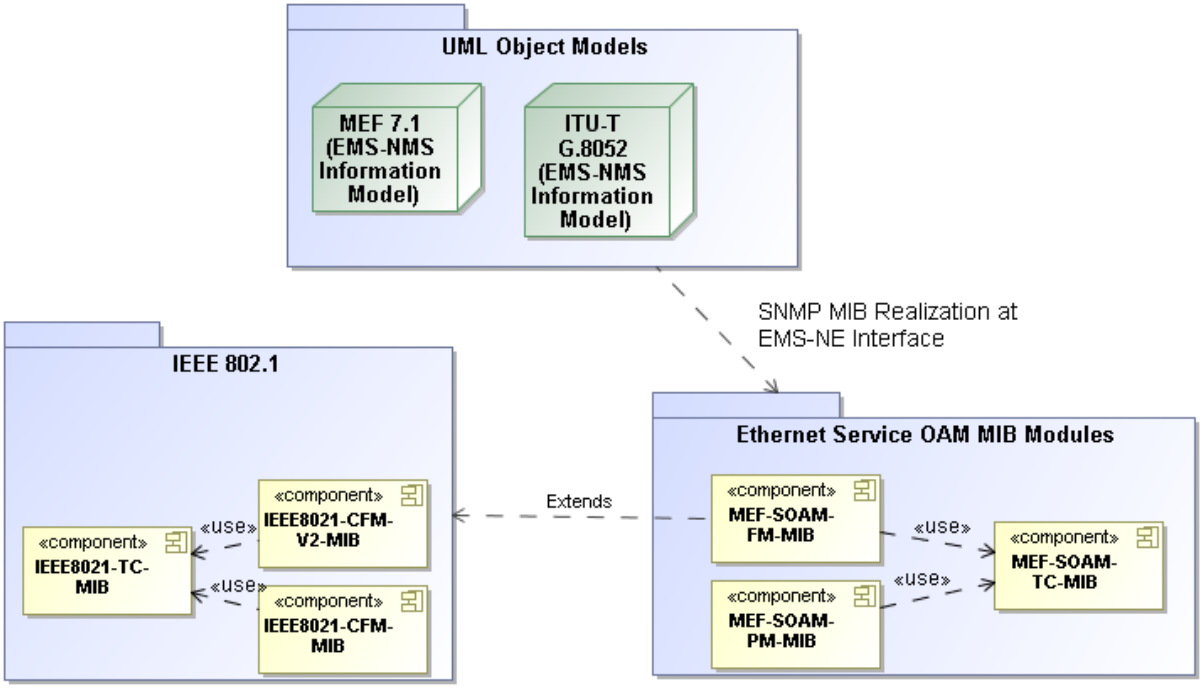

Figure 2 – Relationship between 802.1 CFM MIBs, UML Models, and SOAM MIBs

6. SOAM TC MIB Requirements

The SOAM TC MIB defines the Textual Conventions that are to be used with other MEF SOAM MIB modules.

The SOAM TC MIB defines textual conventions for the following:

- **MefSoamTcConnectivityStatusType** - the connectivity status type of a MEG or MEP
- **MefSoamTcDataPatternType** - defines the data pattern type used in Data TLVs
- **MefSoamTcIntervalTypeAisLck** - defines the interval for sending AIS and LCK PDUs
- **MefSoamTcMegIdType** - defines the MEG ID type
- **MefSoamTcOperationTimeType** - defines when an operation is initiated or stopped
- **MefSoamTcTestPatternType** - defines the test pattern used in Test TLVs

[R1] The SOAM FM MIB **SHALL** use the Textual Conventions defined in the SOAM TC MIB as presented in Section 8.

7. SOAM FM MIB Requirements

The SOAM FM MIB defines the managed objects necessary to support SOAM FM functionality. Its primary point of reference is the SOAM-FM specification [10].

The SOAM FM MIB is an extension to the Connectivity Fault Management (CFM) MIBs as developed in IEEE 802.1ag [20] and IEEE 801.ap [22], to support functionality defined by ITU-T Y.1731 [17] and by the SOAM-FM [10] specification.

Only those items needed to fully support the SOAM-FM [10] but not covered in these other MIBs are included. Areas that need no enhancements are excluded since no new objects are required over the objects defined in the IEEE 802.1ag [20] and 801.ap [22] MIBs.

The SOAM FM MIB is divided into the following groups:

- **mefSoamNet** - defines the objects necessary to support MEG unique functionality. This group augments the standard ***ieee8021CfmMaNetEntry*** row entry as found in 802.1ag [20].
- **mefSoamMeg** - defines the objects necessary to support the enhanced MEG/MA functionality. This group augments the standard ***ieee8021CfmMaCompEntry*** row entry as found in 802.1ap [22].
- **mefSoamMep** - defines the objects necessary to support the enhanced MEP functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- **mefSoamCc** - defines the objects necessary to support the enhanced CCM functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- **mefSoamAis** - defines the objects necessary to implement the ETH-AIS functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- **mefSoamLb** - defines the objects necessary to support the enhanced CFM Loopback functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- mefSoamLt - defines the objects necessary to support the enhanced CFM Linktrace functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- **mefSoamLck** - defines the objects necessary to implement the ETH-LCK functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- **mefSoamTest** - defines the objects necessary to implement the ETH-Test functionality. This group augments the ***dot1agCfmMepEntry*** row entry as found in 802.1ag [20].
- **mefSoamFmNotificationCfg** - defines the objects necessary to configure the **mefSoamFmNotifications**.

- **mefSoamFmNotifications** - defines the notifications necessary to implement Service OAM FM functionality.

[R2] The mefSoamNet group in the SOAM MIB **SHALL** be supported for devices that are compliant with SOAM FM functionality.

[R3] The mefSoamMeg group in the SOAM MIB **SHALL** be supported for devices that are compliant with SOAM FM functionality.

[R4] The mefSoamMepStatusTable in the mefSoamMep group in the SOAM MIB **SHALL** be supported for devices that are compliant with SOAM FM functionality.

[D1] The mefSoamMepFmStatsTable in the mefSoamMep group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[D2] The mefSoamCc group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[D3] The mefSoamAis group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[R5] The mefSoamLbCfgTable and mefSoamLbStatsTable in the mefSoamLb group in the SOAM MIB **SHALL** be supported for devices that are compliant with SOAM FM functionality except for the objects mefSoamLbTestTlvIncluded, mefSoamLbTestTlvPattern, and mefSoamLbCfgTimeout.

[D4] The mefSoamLbCfgTable of the mefSoamLb group for the objects mefSoamLbTestTlvIncluded, mefSoamLbTestTlvPattern, and mefSoamLbCfgTimeout in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[D5] The mefSoamLbrMulticastTable in the mefSoamLb group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[R6] The mefSoamLtStatTable in the mefSoamLt group in the SOAM MIB **SHALL** be supported for devices that are compliant with SOAM FM functionality except for the objects mefSoamLtLtmReceived and mefSoamLtLtrTransmitted.

[D6] The mefSoamLtStatTable in the mefSoamLt group for the objects mefSoamLtLtmReceived and mefSoamLtLtrTransmitted in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[D7] The mefSoamLck group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[D8] The mefSoamTest group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[R7] The mefSoamFmNotifications group in the SOAM MIB **SHALL** be supported for devices that are compliant with SOAM FM functionality except for the mefSoamLckAlarm and mefSoamAisAlarm notifications.

[D9] The mefSoamFmNotifications group for the mefSoamLckAlarm and mefSoamAisAlarm notifications in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

[D10] The mefSoamFmNotificationCfg group in the SOAM MIB **SHOULD** be supported for devices that are compliant with SOAM FM functionality.

MefSoamTcConnectivityStatusType ::= TEXTUAL-CONVENTION
    STATUS      current
    DESCRIPTION
       "This enumeration data type defines the connectivity status
        of a Maintenance Entity (ME) or a Maintenance Entity Group (MEG).

        The valid enumerated values associated with this type are:

        inactive(1)        indicates an inactive connectivity state of a group
                           and refers to the inability to exchange SOAM PDU frame
                           among any of the entities in a group.

        active(2)          indicates an active connectivity state of a group
                           and refers to the ability to exchange SOAM PDU frames
                           among all the entities in a group

        partiallyActive(3) indicates a partially active connectivity state of a
                           group and refers to the ability to exchange SOAM PDU
                           frames among some entities of a group. This enumerated
                           value is only applicable for Multipoint-to-Multipoint
                           MEG.

-- ****************************************************************************
--  Reference Overview
--
--  A number of base documents have been used to create the Textual Conventions
--  MIB, the SOAM-PM MIB and SOAM-FM MIB. The following are the
--  abbreviations for the baseline documents:
--
--  [CFM] refers to 'Connectivity Fault Management', IEEE 802.1ag-2007,
--      December 2007
--  [MEF7.1] refers to MEF 7.1 'Phase 2 EMS-NMS Information Model',
--      October 2009
--  [MEF17] refers to MEF 17 'Service OAM Requirements & Framework - Phase 1',
--      April 2007
--  [MEF10.2] refers to MEF 10.2 'Ethernet Services Attributes Phase 2', Oct 2009
--  [MEF SOAM-PM] refers to 'Service OAM Performance Monitoring - Phase 1
--      Implementation Agreement', January 2010
--  [MEF SOAM-FM] refers to 'Service OAM Fault Management Implementation
--      Agreement', January 2011
--  [Q.840.1] refers to 'ITU-T Requirements and analysis for NMS-EMS
--      management interface of Ethernet over Transport and Metro Ethernet
--      Network (EoT/MEN)', March 2007
-- -[Y.1731] refers to ITU-T Y.1731 'OAM functions and mechanisms for Ethernet
--  -   based networks', February 2008

-- ****************************************************************************
-- MEG Table
-- ****************************************************************************

mefSoamMegCfgTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF MefSoamMegCfgEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
       "This table is an extension of the ieee8021CfmMaCompTable and rows
        are automatically added or deleted from this table based upon row
        creation and destruction of the ieee8021CfmMaCompTable.

        This table represents the Maintenance Entity Group (Y.1731) or
        Maintenance Association (802.1ag). An MEG/MA is a set of MEPs,
        each configured to the same service inside a common OAM domain.

        This is the part of the complete MEG/MA table that is variable
        across the Bridges in a Maintenance Domain, or across the
        components of a single Bridge. Each row in the table represents an
        MEG/MA.

        For a Point-to-Point Ethernet Virtual Connection (EVC), a MEG contains
        a single Maintenance Entity (ME). For a Multipoint-to-Multipoint EVC or
        a Rooted Multipoint EVC associating 'n' User-to-Network Interfaces (UNIs),
        a MEG contains n*(n-1)/2 MEs.

        The writable objects in this table need to be persistent
        upon reboot or restart of a device.

    DESCRIPTION
       "This attribute indicates the connectivity status for a MEP
        in an EVC ME.

        An 'active' MEP Connectivity Status refers to the ability to exchange
        SOAM PDU frames among all the UNIs of an EVC.

        A 'partiallyActive' MEP Connectivity Status refers to the ability to
        exchange SOAM PDU frames among some but not all the UNIs of an EVC.

        An 'inactive' MEP Connectivity Status refers to the inability to
        exchange SOAM PDU frames among any of the UNIs of an EVC.

-- Continuity Check Configuration Table
-- ****************************************************************************

mefSoamCcCfgTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF MefSoamCcCfgEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
       "This table is an extension of the dot1agCfmMepTable and rows
        are automatically added or deleted from this table based upon row
        creation and destruction of the dot1agCfmMepTable.

        This table includes configuration attributes and
```

```
        operations for the proactive Ethernet OAM Fault Management
        and Performance Monitoring Continuity Check function
        (ETH-CC) as defined in Y.1731 and 802.1ag.

        ETH-CC can be used for the following applications:

        - Used to detect loss of continuity between any pair of
           MEPs in a MEG.

        - Used to detect unintended connectivity conditions and
          other defect conditions.

        The OAM PDU used for ETH-CC and ETH-RDI information is CCM.

        This table also includes configuration attributes for the
        Ethernet OAM Fault Management Remote Defect Indication
        function (ETH-RDI) as defined in Y.1731. ETH-RDI can be
        used for the following applications:

        - Single-ended fault management: The receiving MEP
          detects an RDI defect condition, which gets correlated
          with other defect conditions in this MEP and may become a
          fault cause. The absence of received ETH-RDI information
          in a single MEP indicates the absence of defects in the
          entire MEG.

        - Contribution to far-end performance monitoring: It
          reflects that there was a defect condition in the far end
          which is used as an input to the performance monitoring
          process.

        ETH-CC and ETH-RDI functions are only applicable to MEPs.

        The writable objects in this table need to be persistent
        upon reboot or restart of a device.
       "

mefSoamLbCfgTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF MefSoamLbCfgEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
       "This table is an extension of the dot1agCfmMepTable and rows
        are automatically added or deleted from this table based upon row
        creation and destruction of the dot1agCfmMepTable.

        This table includes configuration attributes and
        operations for the on-demand Ethernet OAM Fault Management
        Loopback function (ETH-LB) as defined in Y.1731 and
        802.1ag. ETH-LM can be used for the following applications:
            - To verify bidirectional connectivity of a MEP with a MIP
              or a peer MEP.
            - To perform a bidirectional in-service or out-of-service
              diagnostics test between a pair of peer MEPs. This includes
              verifying bandwidth throughput, detecting bit errors, etc.
        The OAM PDU used for ETH-LB request information is LBM. The
        OAM PDU used for ETH-LB reply is LBR. Unicast frames
        carrying the LBM PDU are called Unicast LBM frames. Unicast
        frames carrying the LBR PDU are called Unicast LBR frames.
        Multicast frames carrying the LBM PDU are called Multicast
        LBM frames. Multicast frames carrying the LBR PDU are
        called Multicast LBR frames.

        This functionality is similar to a 'ping'.

        The writable objects in this table need to be persistent

mefSoamLbCfgFrameSize OBJECT-TYPE
    SYNTAX      Unsigned32 (64..9600)
    UNITS       "bytes"
    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
       "This attribute specifies the LBM frame size. For an LB Session, the
        size of the LBM frame is configurable to any Ethernet frame size
        between 64 Bytes and the maximum transmission unit of the EVC.

        The range of frame sizes from 64 through 2000 octets, in 4 octet
        increments, MUST be supported, and the range of frame sizes from 2004
        through 9600 octets, in 4 octet increments, SHOULD be supported.

        The adjustment to the frame size of the standard LBM PDU size is
        accomplished  by the addition of a Data TLV or a Test TLV.

        Since the original IEEE8021-CFM-MIB defines the LBM frame size through
        the use of the Data TLV object (dot1agCfmMepTransmitLbmDataTlv) the
        mefSoamLbFrameSize object interacts with the
        dot1agCfmMepTransmitLbmDataTlv object in the following ways:

        - If dot1agCfmMepTransmitLbmDataTlv is not zero length, the four new
          objects, mefSoamLbFrameSize, mefSoamLbDataPattern,
          mefSoamLbTestTlvIncluded and mefSoamLbTestTlvPattern are ignored.
```

```
        - Otherwise, if mefSoamLbFrameSize is non-zero then a Test TLV or Data
          TLV is included dependent upon the value of mefSoamLbTestTlvIncluded.
          The TLV included in the LBM frame is of sufficient length to result in an
          Ethernet frame of the size requested.

        - If a Data TLV is included (mefSoamLbTestTlvIncluded is 'false'), the
          contents are specified by mefSoamLbDataPattern.

        - If a Test TLV is included (mefSoamLbTestTlvIncluded is 'true'), the
          contents are specified by mefSoamLbTestTlvPattern.

-- ****************************************************************************

mefSoamLckCfgTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF MefSoamLckCfgEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
       "This table is an extension of the dot1agCfmMepTable and rows
        are automatically added or deleted from this table based upon row
        creation and destruction of the dot1agCfmMepTable.

        This table includes configuration attributes and
        operations for the on-demand Ethernet OAM Fault Management
        Locked Signal function (ETH-LCK) as defined in Y.1731.
        ETH-LCK can be used for the following applications:

        - Used to communicate the administratively locking of a MEP
          and consequential interruption of data traffic forwarding
          toward the MEP expecting this traffic. This allows a MEP
          receiving ETH-LCK frames to distinguish between defect
```

```
          conditions and an administrative locking action.

        - Used by other OAM functions which require a MEP to be
          administratively locked, such as for out-of-service
          testing.

        The OAM PDU used for ETH-LCK information is LCK. VLAN encapsulation on
        the generated ETH-LCK PDU is application dependent and dependent upon
        the level on which it is generated.

        The writable objects in this table should be persistent
        upon reboot or restart of a device. It is not mandatory that they are
        persistent.

-- ****************************************************************************

mefSoamTestCfgTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF MefSoamTestCfgEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
       "This table is an extension of the dot1agCfmMepTable and rows
        are automatically added or deleted from this table based upon row
        creation and destruction of the dot1agCfmMepTable

        This table includes configuration attributes and
        operations for the on-demand OAM Fault Management Test
        function (ETH-Test) defined in Y.1731. The OAM PDU used
        for ETH-Test information is TST. This
        function is only applicable to MEPs.

        The writable objects in this table need to be persistent
        upon reboot or restart of a device.

        Steps to use entries in this table:

        1) Wait for mefSoamTestOutStatus value to be false by the following
           sequence:
           a. an SNMP GET for both SnmpSetSerialNo (SNMPv2-MIB, RFC 3418) and
              mefSoamTestOutStatus objects (in same SNMP PDU).
           b. Check if value for mefSoamTestOutStatus is false.
              - if not, wait a second, go to step a above.
              - if yes, save the value of SnmpSetSerialNo and go
                to step 2) below
        2) Change mefSoamTestOutStatus value from false to true to ensure
           no other management entity will use the service. In order to
           avoid contention with other SNMP Managers, send an SNMP SET
           for both SnmpSetSerialNo and mefSoamTestOutStatus objects (in same
           SNMP PDU, and make sure SnmpSetSerialNo is the first varBind).
           For the SnmpSetSerialNo varBind, use the value that you obtained
           in step 1)a.. This ensures that two cooperating SNMP Managers will
           not step on each other's toes.
        3) Setup the different data to be sent and time to start, except do not
           set mefSoamTestOutEnabled.
        4) Record the current values of mefSoamTestNumIn,
           mefSoamTestNumInOutOfOrder, mefSoamTestNumInCrcErrors,
           mefSoamTestNumInBerErrors, mefSoamTestNumOut.
        5) Set mefSoamTestOutEnabled to a 'true' value to initiate
           transmission of ETH-Test messages.
```

```
        6) Monitor the value of mefSoamTestOutEnabled. When it is reset to
           false, the last TST frame has been transmitted.
        7) Compare mefSoamTestNumIn, mefSoamTestNumInOutOfOrder,
           mefSoamTestNumInCrcErrors, mefSoamTestNumInBerErrors,
           mefSoamTestNumOut to their old values from step 4, above, to get
           the results of the test.
        8) Change the mefSoamTestOutStatus value back to false to allow
           other management entities to use the table.

mefSoamAlarmInterval OBJECT-TYPE
    SYNTAX      Unsigned32 (0..60)
    UNITS       "Seconds"
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
       "A value indicating the shortest time interval in seconds between the
        generation of the same notification type per MEP to the list of
        notification destinations. An agent shall generate the first notification
        of given type for a given MEP immediately. An agent shall not generate a
        second specific notification of the same type for the same MEP until the
        time interval has expired. A value of zero indicates that all
        notifications are sent immediately upon detection of the condition.

mefSoamMepDefectAlarm NOTIFICATION-TYPE
    OBJECTS     {
                dot1agCfmMepDefects,
                mefSoamMepStatusLastDefectSentStatus,
                dot1agCfmMepDbRMepState
                }
    STATUS      current
    DESCRIPTION
       "An mefSoamMepDefectAlarm notification is sent when the value of
        dot1agCfmMepDefects changes. It indicates a persistent defect
        in the MEP. This notification is sent whenever the dot1agCfmMepDefects
        of the MEP changes, regardless of the dot1agCfmMepHighestPrDefect object.

        The inclusion of the dot1agCfmMepDbRMepState object is optional. It
        shall not be included if the defect is not based upon a specific MEP
        instance, e.g.. bDefErrorCCM.

        The management entity that receives the notification can identify
        the system from the network source address of the notification,
        and can identify the individual local MEP reporting the defect by the
        OID indices in the dot1agCfmMepDefects object.

        When included, the dot1agCfmMepDbRMepState object indicates the remote
        MEP that caused the defect by the OID indices in the object.

        An agent should not generate more than one mefSoamMepDefectAlarm
        'notification-event' in a given time interval per MEP as specified by
        mefSoamAlarmInterval.  A 'notification-event' is the transmission
        of a single notification to a list of notification destinations.

        If additional defect changes occur within the mefSoamAlarmInterval
        period, then notification generation for these changes shall be
        suppressed by the agent until the current alarm interval expires.  At
        the end of an alarm interval period, one notification-event shall be
        generated if any defect changes occurred since the start of the alarm
        interval period. In such a case, another alarm interval period is
        started right away.
       "

mefSoamConfigErrorAssertAlarm NOTIFICATION-TYPE
    OBJECTS     {
                ieee8021CfmConfigErrorListErrorType
                }
    STATUS      current
    DESCRIPTION
       "An mefSoamConfigErrorAssertAlarm notification is sent when an entry
```

```
        is added to the ieee8021CfmConfigErrorListTable. It indicates a
        configuration error during the setup for SOAM FM entity and provides
        a list of Interfaces and VIDs that are incorrectly configured.

        This notification is sent whenever a configuration error occurs.

        The management entity that receives the notification can identify
        the system from the network source address of the notification,
        and can identify the individual configuration reporting the error
        by the indices in the OID ieee8021CfmConfigErrorListErrorType,
        including the ieee8021CfmConfigErrorListSelectorType,
        ieee8021CfmConfigErrorListSelector, and the
        ieee8021CfmConfigErrorListIfIndex.

        An agent should not generate more than one mefSoamConfigErrorAssertAlarm
        'notification-event' in a given time interval as specified by
        mefSoamAlarmInterval.  A 'notification-event' is the transmission of a
        single notification to a list of notification destinations.

        If additional configuration errors occur within the mefSoamAlarmInterval
        period, then notification generation for these changes shall be
        suppressed by the agent until the current alarm interval expires.  At
        the end of an alarm interval period, one notification-event shall be
        generated if any configuration errors occurred since the start of the
        alarm interval period. In such a case, another alarm interval period is
        started right away.

                }
    STATUS      current
    DESCRIPTION
       "An mefSoamConfigErrorClearAlarm notification is sent when an entry is
        deleted from the ieee8021CfmConfigErrorListTable. It indicates a
        configuration error has been removed during the setup for SOAM FM
        entity and provides a list of Interfaces and VIDs that are correctly
        configured.

        This notification is sent whenever a configuration error has been
        cleared.

        The management entity that receives the notification can identify
        the system from the network source address of the notification,
        and can identify the individual configuration reporting the error
        clear by the indices in the OID ieee8021CfmConfigErrorListErrorType,
        including the ieee8021CfmConfigErrorListSelectorType,
        ieee8021CfmConfigErrorListSelector, and the
        ieee8021CfmConfigErrorListIfIndex.

        An agent should not generate more than one mefSoamConfigErrorClearAlarm
        'notification-event' in a given time interval as specified by
        mefSoamAlarmInterval.  A 'notification-event' is the transmission of a
        single notification to a list of notification destinations.

        If additional configuration error clears occur within the
        mefSoamAlarmInterval period, then notification generation for these
        changes shall be suppressed by the agent until the current alarm
        interval expires. At the end of an alarm interval period, one
        notification-event shall be generated if any configuration error clears
        occurred since the start of the alarm interval period. In such a case,
```

```
        another alarm interval period is started right away.
