E-LAN

An E-LAN is a multipoint-to-multipoint service that connects a number of UNIs (2 or more) providing full mesh connectivity for those sites. Each UNI can communicate with any other UNI that is connected to that Ethernet service.

Example(s)

E-LANs are used to create:

- Multipoint L2 VPNs
- Transparent LAN services
- Layer 2 VPNs (L2VPN)
- Foundation for IPTV and Multicast networks
