Abstract

"This document specifies the requirements and test methodologies for Service Activation Testing (SAT) of MEF defined E-Line, Access E-Line and Transit E-Line services. SAT is a test process used to validate that a service behaves as per its Service Definition i.e. as specified in terms of values for all of the Service Attributes of the service, as per [MEF 6.2](#), [MEF 10.3](#) and [MEF 45.1](#) for E-Line and as per [MEF 51.1](#), [MEF 26.2](#) and [MEF 45.1](#) for Access E-Line and Transit E-Line.

It encompasses the verification of the service configuration, performance and the issuance of a SAT Record. Service Activation Testing is performed after service provisioning, before the service is delivered to the customer."
