

Operator

MEF 26.1 expands the basic model (described in [MEF 10.x](#)) to facilitate the cases where the service spans multiple [Carrier Ethernet Networks \(CEN\)](#) operated by different administrative entities.

Each CEN is managed by an **Operator** where the Operator provides connectivity services to the [Service Provider](#) that in turn provides the [UNI](#)-to-UNI (end-to-end service) to the [Subscriber](#) (as described in the MEF 10.x model)
